

Yr 9 Computer Science

Transition Activities

For this transition task you need to:

- Read the slides on **Application software**
- Complete the tasks stated on **slide 9** along on the word document
- Read the slides on **Operating systems**
- Complete the tasks stated on **slide 29** along on the word document
- Read the slides on **Utility software**
- Complete the tasks stated on **slide 48** along with the word document

Application Software

**Application and
system software**

PG ONLINE

1

Objectives

- Explain the terms hardware and software
- Explain what is meant by system software and application software and give examples of each

Hardware and software

- A computer system is made up of hardware and software
- **Hardware** is any physical component that makes up the computer
- **Software** is any program that runs on the computer

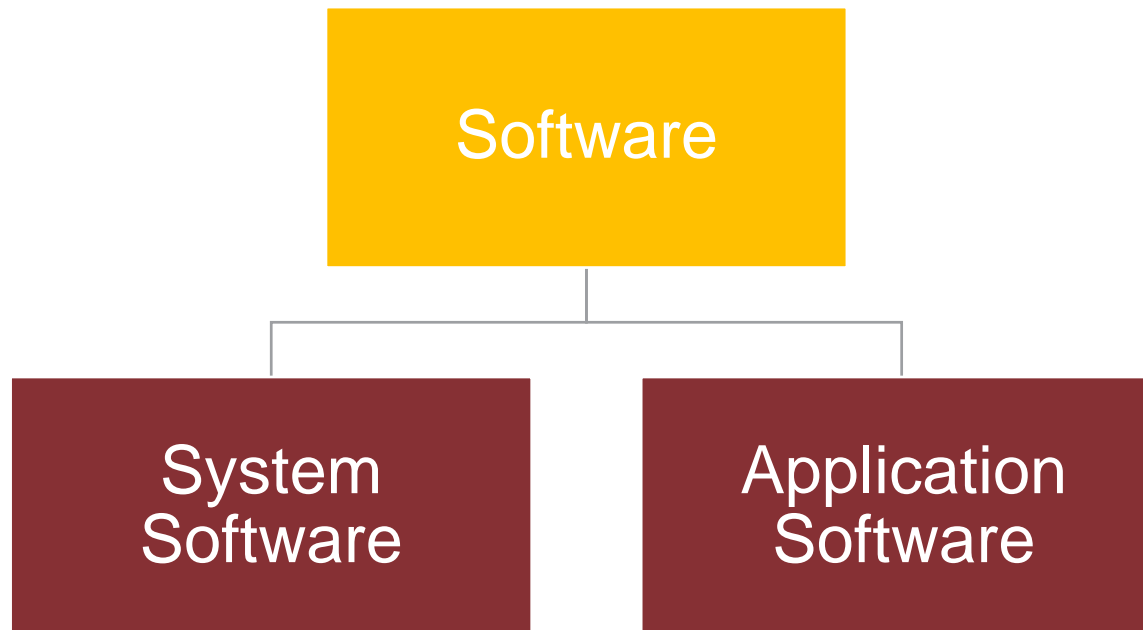

What software can you name?

- In pairs or small groups name as many pieces of software as you can in one minute

Categories of software

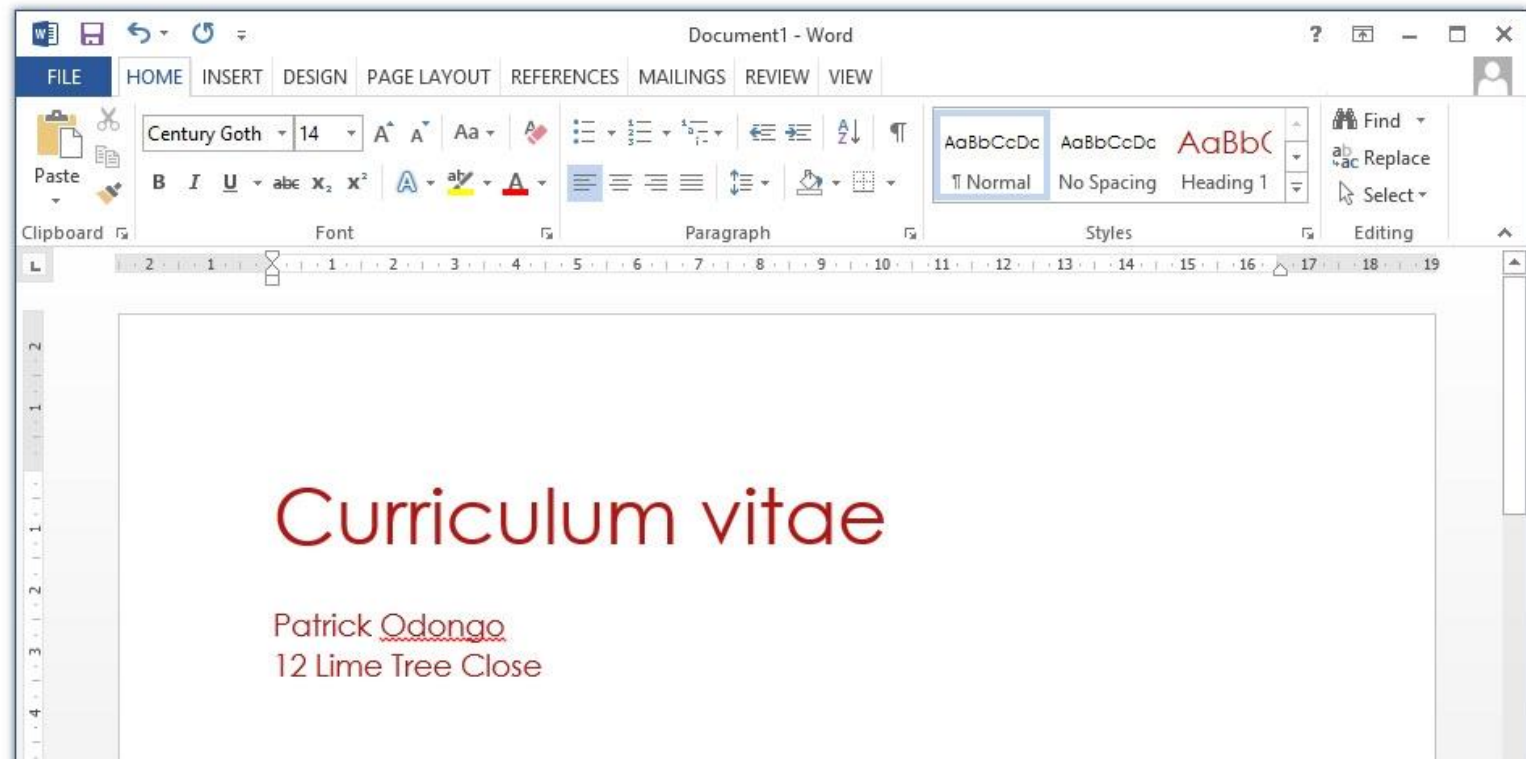

System software

- Programs that are needed to enable the computer to function
 - For example, an operating system such as Windows

Application software

- Programs that are needed to perform tasks for the user
 - For example, word processing software

Activity:

Complete **Task 1** on the word document.

DVD RW Drive (I:)

OS (C:)

316 GB free of 455 GB

Operating Systems

**Application and
system software**

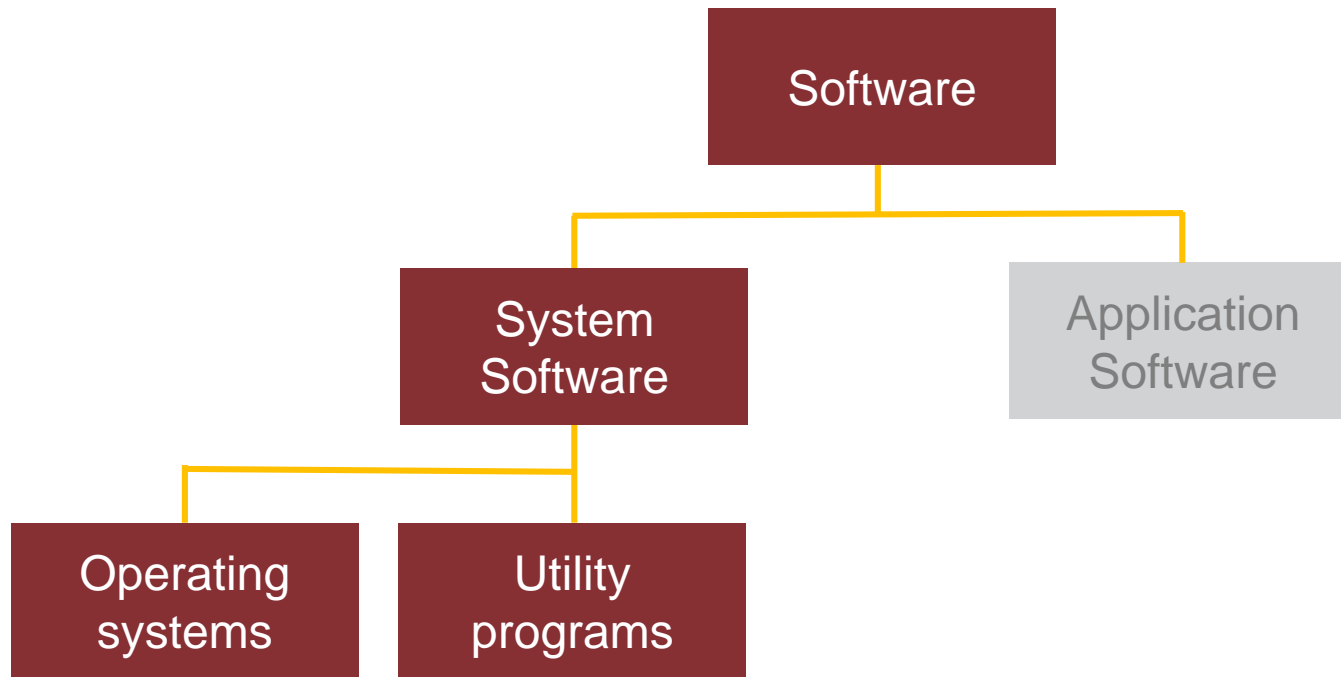

PG ONLINE

2

Objectives

- Understand that the OS handles management of the processor, memory, I/O devices, applications and security
- Understand the need for and functions of operating systems (OS) and utility programs

Types of system software

What operating systems have you heard of?

- Android is the most widely used operating system
- In pairs, write down any other operating systems that you've heard of

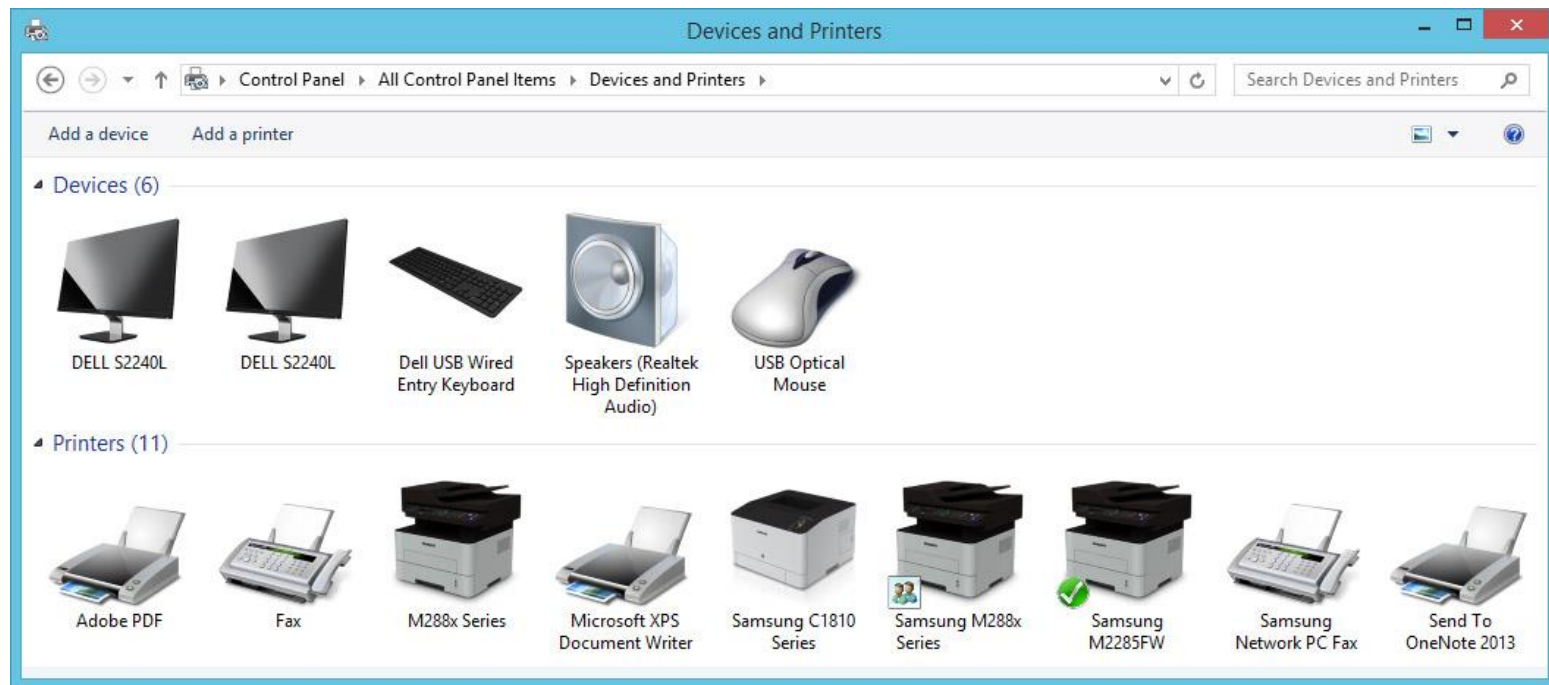

Some operating systems

- Android OS
 - Versions have nicknames such as Lollipop and Marshmallow
- OS X (Apple Mac)
 - Versions have nicknames such as “El Capitan” and “Sierra”
- iOS (iPhone/iPad)
- Windows
- Google Chrome OS (based on Linux)
- Linux

Operating system definition

“Software that ... manages a computer’s hardware and provides a user interface”

Functions of an operating system

- An operating system:
 - provides a **user interface**
 - manages how programs use **main memory**
 - allows **processor management**
 - manages **peripherals**
 - manages **applications**
 - provides **security**

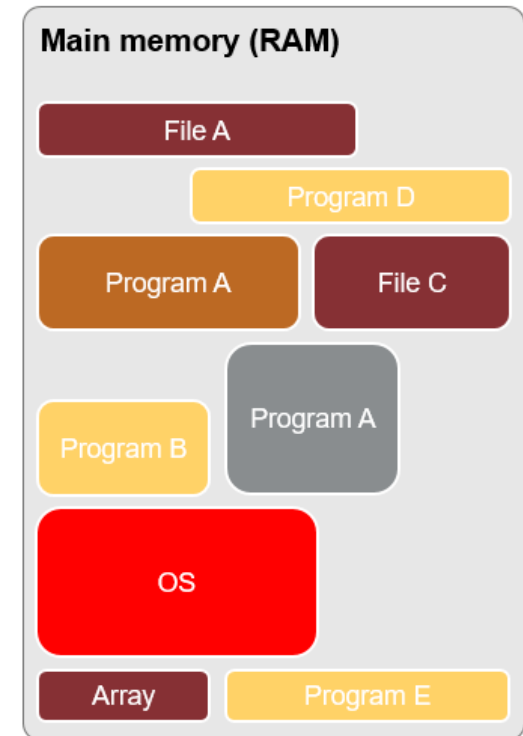

User Interface

- Without a user interface we would have to communicate in binary!
 - The user interface for a device has to suit how it is used....
 - How many types of interface can you name?
- 

Memory management

- When a program is running, the computer must copy the program from storage into main memory
 - When you start a program (i.e. Word) or access data, the memory manager allocates blocks of free space in memory
 - It keeps a record of where each program and its data are located
 - The memory manager frees up this space when you stop using the program or data

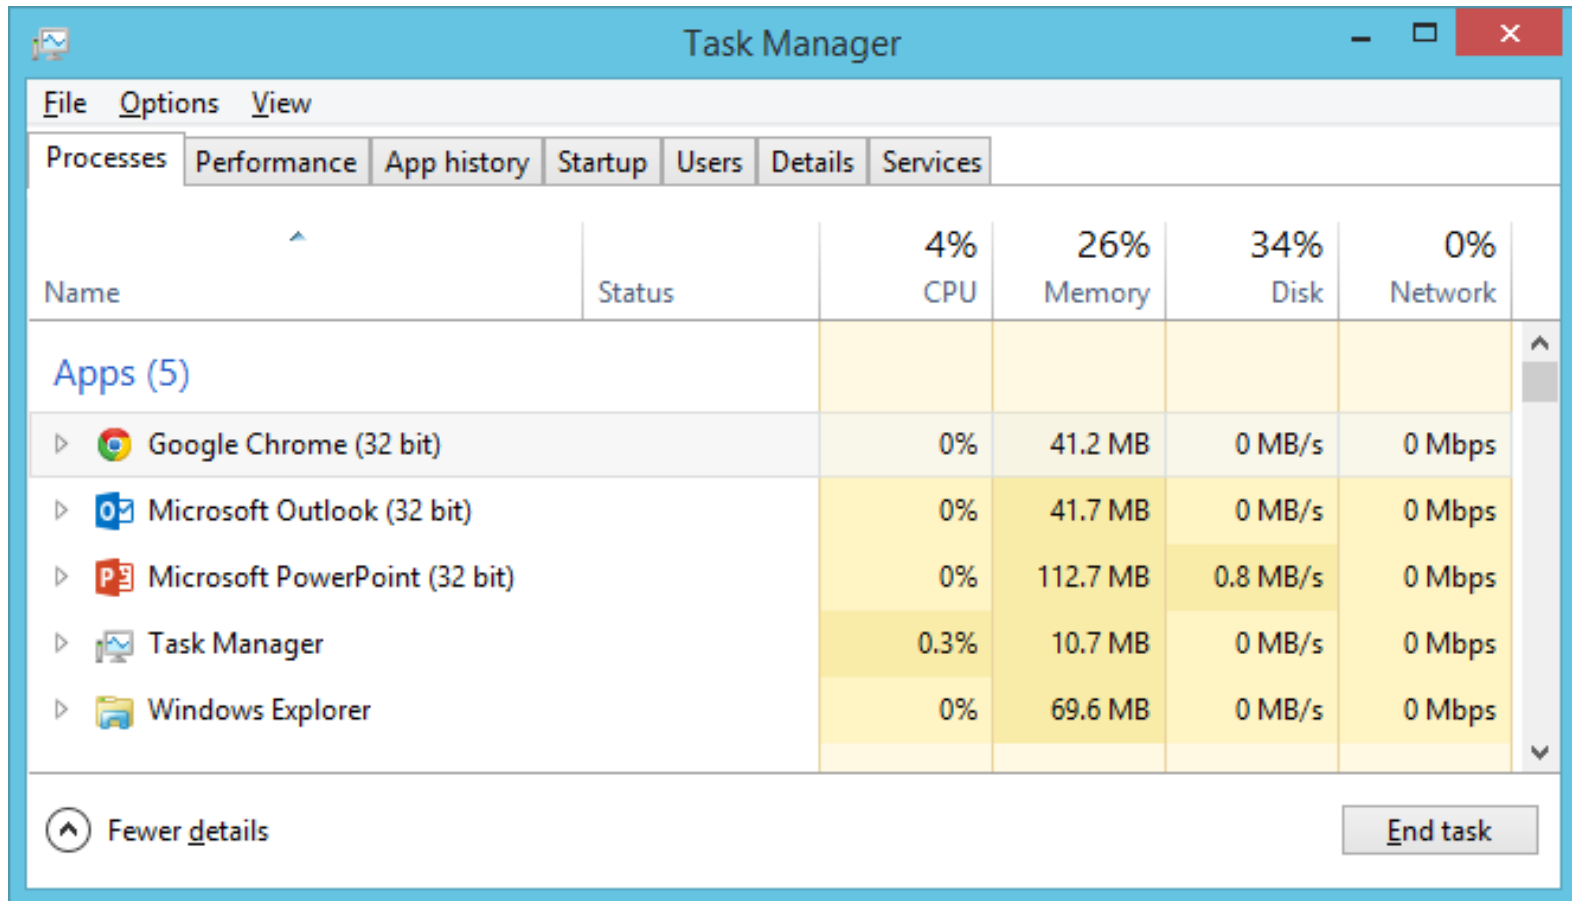

Processor management

- You may use your computer to do several tasks at the same time with different software: homework, playing music, messaging friends...
 - There are many background programs running on the computer as well
 - They are taking it in turns to get processor time to execute instructions
 - The OS must manage how the programs share the processor

Task Manager

The screenshot shows the Windows Task Manager application window. The title bar is blue and contains the text "Task Manager" and standard window controls. Below the title bar is a menu bar with "File", "Options", and "View". Under "Options", there are tabs for "Processes", "Performance", "App history", "Startup", "Users", "Details", and "Services". The "Processes" tab is selected, displaying a table of running applications. The table has columns for Name, Status, CPU, Memory, Disk, and Network. A section titled "Apps (5)" is expanded, showing five applications: Google Chrome (32 bit), Microsoft Outlook (32 bit), Microsoft PowerPoint (32 bit), Task Manager, and Windows Explorer. At the bottom left, there is a "Fewer details" button with an upward arrow icon. At the bottom right, there is an "End task" button.

Name	Status	CPU	Memory	Disk	Network
Apps (5)					
Google Chrome (32 bit)		0%	41.2 MB	0 MB/s	0 Mbps
Microsoft Outlook (32 bit)		0%	41.7 MB	0 MB/s	0 Mbps
Microsoft PowerPoint (32 bit)		0%	112.7 MB	0.8 MB/s	0 Mbps
Task Manager		0.3%	10.7 MB	0 MB/s	0 Mbps
Windows Explorer		0%	69.6 MB	0 MB/s	0 Mbps

Peripheral management

- Peripherals are all the devices outside of the CPU
 - Includes input and output devices, and secondary storage
- The OS uses a **device driver** to manage these devices— a small program that acts as an interface between the computer and the device

Sending data to a printer

- The computer can send data thousands of times faster than the printer can print it
- The computer sends the printer output to a **print buffer**, a special area of memory in either the computer or the printer, at full speed
 - From here, it is transmitted to the printer, typically a page at a time
 - The print buffer may store a number of jobs waiting to be printed
 - If the printer cannot print, the OS is notified and passes on the message to the user, e.g. “Offline” or “Printer out of paper”

The print buffer

- The screenshot shows a print buffer in action
 - It shows the status of each job in the buffer, and whether it is printing or waiting its turn

Document Name	Status	Owner	Pages	Size	Submitted
 Full page photo	Printing	Guest	N/A		13:27:41 30/06/2015
 Full page photo	Spooling	Guest	1	5.25 MB	13:27:41 30/06/2015
 Full page photo	Spooling	Guest	1	7.00 MB	13:27:37 30/06/2015

Storage device management

- The operating system must manage:
 - Copying files from disk to main memory
 - Copying data files back to secondary storage

Disk and file management

- The hard disk in a computer is a storage peripheral
- The operating system:
 - manages where on the disk files are written
 - keeps track of where they are so they can be retrieved
 - makes sure no file overwrites another file

Application management

- Application programs need an OS to function
 - When you install a new application on your computer, the OS will run a program to install it
 - The OS will interact with applications through an **Application Programming Interface (API)**
 - The API allows the application to communicate with the OS

Managing security

- The operating system organises user logins and passwords

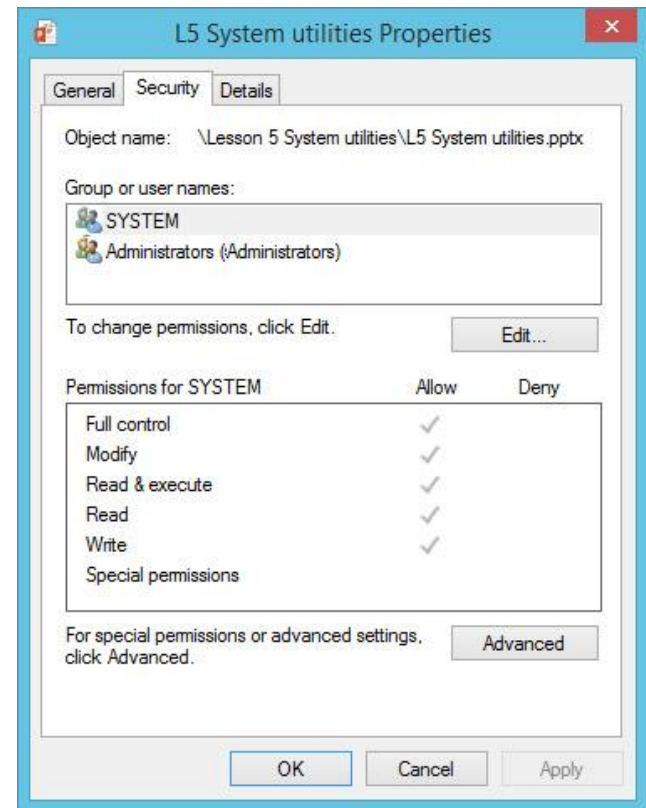

A login form with two input fields and a sign-in button. The first field is labeled "User name:" and the second field is labeled "Password:". Both fields are yellow with a thin black border. To the right of the password field is an orange button with the text "Sign in" in white.

- May include password protection on individual files
- Controls access rights

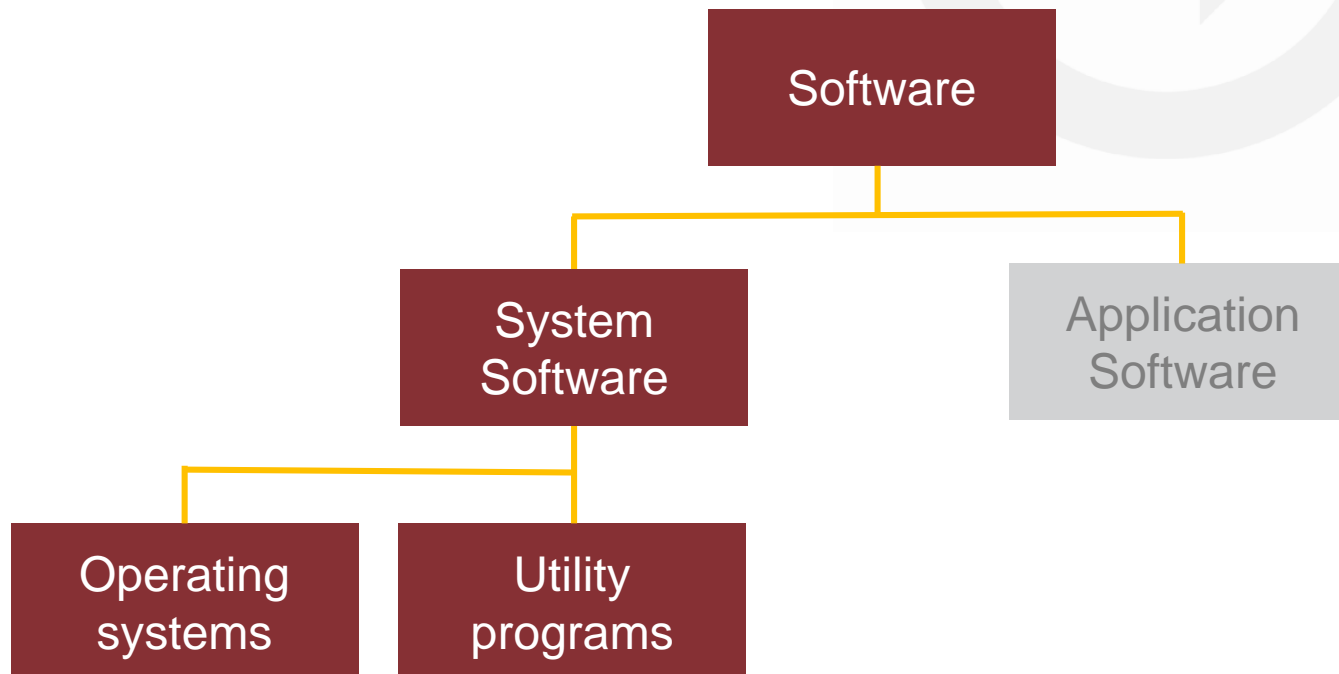

Access rights

- Access rights:
 - If a computer is used by more than one person, each user should be able to see only their own files
 - Users and system administrators have different levels of access rights
 - Some users may be allowed to read files but not edit them
- May include file encryption

Activity:

Complete **Task 2** on the word document.

Utility Software

Application and system software

PG ONLINE

3

Objectives

- Understand the need for and functions of operating systems (OS) and utility programs

What are utilities?

- The Operating System controls and manages the computer system
- Utilities provide extra functionality that make it easier to use
- They can be packaged as part of the Operating System or bought as stand-alone software programs

Types of utility program

- Utilities can be grouped into categories:

Computer security

File organisation

System maintenance

Security utilities

- These include:
 - Anti-virus software
 - Spyware protection
 - Firewalls
 - Back-up and recovery programs

Anti-virus software

- A virus is a malicious computer program written to cause damage to files or inconvenience to the user
- Anti-virus software:
 - Prevents viruses being installed
 - Prevents system files being deleted or changed
 - Detects and removes viruses that do manage to install themselves
- New viruses are always being invented so anti-virus software must be regularly updated

Spyware protection

- Spyware are programs that secretly record what you are doing on your computer e.g. key logger software
- Spyware records data such as:
 - Usernames and passwords
 - Bank account/credit card details
- Spyware protection software detects spyware programs and prevents them from installing themselves on your computer

Firewall software

- Prevents unauthorised access to a computer or network from the internet
- Can use filtering to prevent access to unsuitable sites from a computer or network

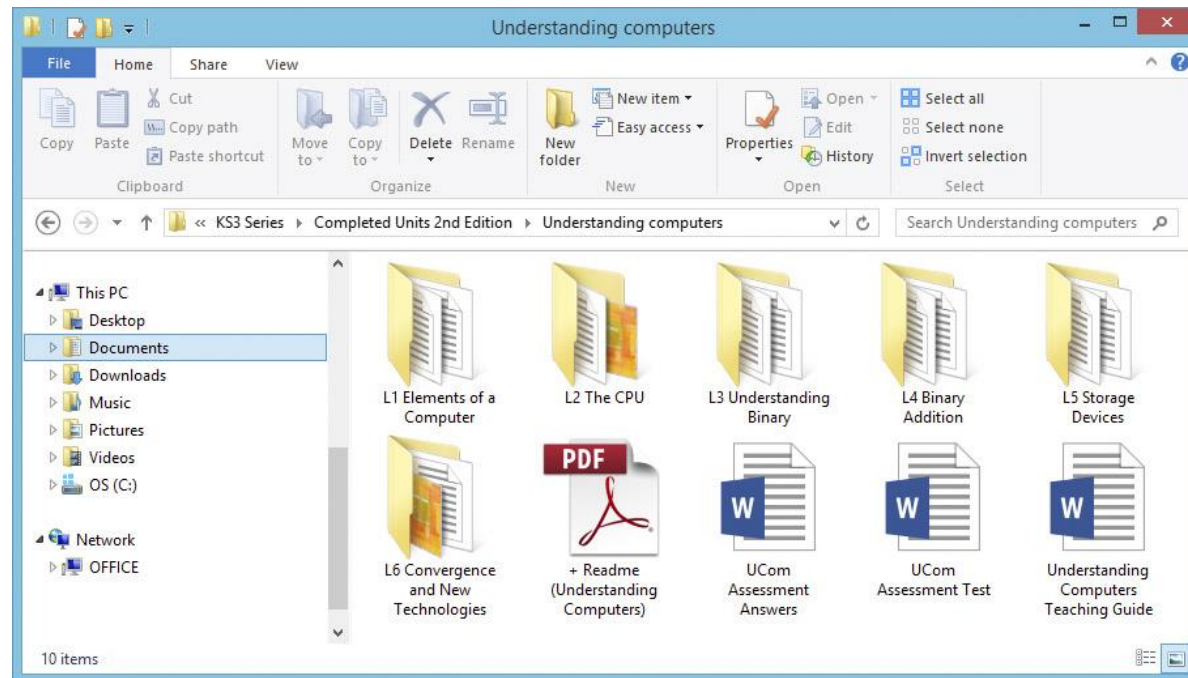

File organisation utilities

- These include:
 - File management and transfer
 - Disk defragmentation

File management

- The tools we use all the time for managing our files
 - Move, copy and delete folders and files

Repairing corrupted files

- Files can be corrupted by viruses, system crashes or network errors, so they become unreadable

- File repair software scans the damaged file and extracts the maximum data from it to create a new, usable file

Saving files on disk

- When you save a large file, it is divided up into equal-sized blocks or “clusters” of typically 4K bytes
 - A file of 1 - 4096 bytes occupies 4096 bytes
 - A file of 4097 bytes occupies 8192 bytes
- A large file may not fit on the disk in consecutive blocks
- The file is referred to as “fragmented”
 - Retrieving data from the file takes more processing
 - More processing means reduced performance

Disk defragmentation

- Defragmenting the hard disk reorganises files so they are stored together
 - Processing time reduces so performance is improved
 - Free space is also in one place so new files do not have to be fragmented

Defragmentation

Yellow	Yellow	Brown	Brown	Brown	Grey	Red	Red
Red	Red	Red	Yellow	Yellow	White	Yellow	White
Grey	Grey	Grey	White	Red	Red	White	Grey
White	White	White	White	White	White	White	White
White	White	White	White	White	White	White	White

Before:
Files stored
are fragmented

Yellow	Yellow	Yellow	Yellow	Yellow	Brown	Brown	Brown
Red	Red	Red	Red	Red	Red	Red	Grey
Grey	Grey	Grey	Grey	White	White	White	White
White	White	White	White	White	White	White	White
White	White	White	White	White	White	White	White

After:
Files and free
space now
defragmented

Automatic update

- Companies issue updates to software regularly
- For software that is installed on the computer, the automatic update will:
 - Look for recent updates on the internet;
 - Download new versions; and
 - Install them
- It can be configured to do any or all of these steps automatically

Automatic update reminder

Backup utilities

- You need to back up data on your hard disk – why?
- Windows has a **Backup and Restore** utility which will create a backup of your files on a regular schedule
- You need to save the backed up data onto an external hard drive
- Organisations from the smallest companies to the largest banks, cannot afford to lose any data
- Commercial backup utilities make sure that even in the event of fire or flood, all data can be recovered

Compression utilities

- A utility program such as WinZip can compress files so that they take up less space
- This is useful if for example you want to transmit a large file or folder via the Internet
- Often, there is a limit to the size of a file that you can attach to an email
 - A smaller, compressed file will transmit and download much faster

Activity:

Complete **Task 3 & 4** on the word document.
